

FLOW & PRESSURE MEASUREMENTS

AREA OF EXPERTISE

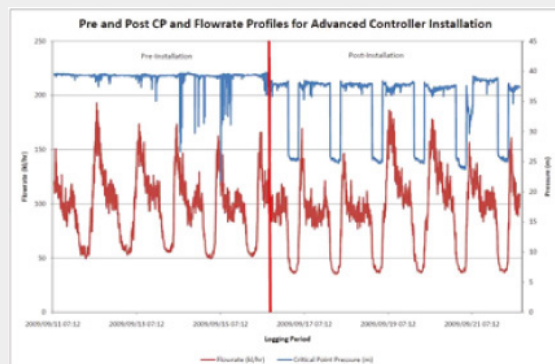

Before a Water Supply Authority can make any decisions concerning the optimization or augmentation of their water distribution network, it is vital that accurate flow and pressure data be recorded. This enables planners and design engineers to fully understand the hydraulic behaviour of their system.

It is vital that accurate flow and pressure data be offered professional and efficient service in assisting Clients in obtaining valuable system information in the form of the demand and pressure profiles.

Fully equipped field teams are available to secure these measurements from virtually any point within a supply network and provide either raw or processed data in any form required.

JOAT provides the following equipment to assist in field data collecting:

- Pressure Loggers
- Flow Loggers
- Portable Flow Measuring Equipment
